

Code Delivery Process Overview

The delivery of application source code for analysis with CAST AIP is performed by the application team with the support of the CAST Admin using the Delivery Manager Tool (DMT) from Cast's AIC Portal. The CAST AIC Portal (introduced with CAST AIP version 7.1) is a web based application which acts as the "intermediary" between the application team, and the CAST Admin. It is used to:

- Register a new applications for analysis with CAST AIP (this task is performed by the CAST Administrator) and is discussed in [here](#).
- [Download and Install the CAST Delivery Manager Tool](#).
- [Create a new Version](#)
- [Add a source code package](#) and any [application databases](#)
- [Package the Version](#)
- [How do I validate and fine-tune my Version](#)
- [Exclude project and/or files/ folders](#)
- [Deliver the Version to the CAST AIC Portal](#)

The first time an application source code is delivered for analysis with CAST AIP the delivery also includes the submission of key relevant technical documents. This video provides an in-depth walk-through of the source code delivery process, using the AIC Portal and the Delivery Manager Tool (DMT).
