

Administration Center - Settings - Source Folder Location

^ Source folder location

Location *

C:\CAST\temp

Provide either UNC path `\\server\source_code` or local path `c:\source_code` or mapped/subst drive `z:\source_code`, that is accessible from all AIP Nodes. More information is available [here](#)

SAVE

This panel provides options to configure a **specific folder** that can be used to **deliver source code** from. When configured, this method of delivery is in **addition** to the existing method to deliver source code as a ZIP file. The path should be a folder path, and should contain folders. The following path syntax is supported:

UNC network path	\\server\source_code
Local path (on the server hosting the AIP Console)	C:\source_code
	C:/source_code
	D:\source_code\temp
	D:/source_code/temp
Mapped or subst drives	S:\
	T:\source_code

- Each **AIP Node** must have **read access** to this path
- When using a **Windows service** to start the AIP Node, the login configured to run the service must have read access to this path.
- If you have issues with regard to the accessibility of a **mapped/subst drive**, you can resolve it using the **map-drives.bat** file. See [Configure AIP Node storage folder locations - optional](#) for more information about this.

When the option is configured, and you **create a new version**, you can choose to deliver direct from this designated folder:

Add Source code Exclusion Rules Objectives

NO FILE OR FOLDER SELECTED

Drag and drop or click to upload a *.zip, *.tar.gz file **or select a folder** 

Only one folder in the designated path can be selected, so please ensure that all source code is presented in one "root" folder (you can organise it however you need to underneath this root folder):

 Note that **changing the source folder location** between successive versions of the same Application will cause any Versions that were delivered using the previous source folder location to become "read only" in the [Version management screen](#). CAST therefore recommends that you should avoid changing the source folder if you need to view details of previous Versions.
