

# How do I create a new application source code version

 This section is aimed at Delivery Managers.

Although the CAST Delivery Manager Tool is generally used by the Application Team's Delivery Manager within the application team to extract, package and deliver the source code, in some deployment scenarios, the CAST Admin may be responsible for the application source code extraction and deliver on behalf of the Application Team.

In the CAST Management Studio and the CAST Delivery Manager Tool, source code is organised into **Versions** - the idea being that you can create new Versions when the Application's source code changes and you want to measure these changes.

The first Delivery Manager that works with the Application will need to **add a new empty Version**. This is explained below:

- In the **CAST Delivery Manager Tool** click the  button to add a new **Version**

- The **Add New Version wizard** will then be displayed:

**Add New Version**

**Set version properties**

Name: V1

Date of release: April 2013, 10:30

< Back   Next >   Finish   Cancel

- Enter a **name** for your Version - in the above example we have chosen "V1"
- Choose the **release date** for your Version - by default the current date will be selected
- Click **Finish** to complete the configuration of the Version.
- The **Version screen** will then be displayed:

Delivery for MEUDON - http://cemaes:8080/CAST-AICPortal

Quit Save Undo Redo Help Package... Deliver... Refresh

MEUDON / V1

Version name: V1

Delivery State: Not Delivered

Copied from version:

Version Date: 18/11/13

Content State: No package unit

Action required: Add package unit(s)

The source code is delivered to the AI Center in packages. A package is defined as...

Packages

Location	Name

- Note that the **Content State** and **Action required** fields indicate that you do not yet have any source code packages.
