

Enabling Management Service schema lock mechanism

In some situations (i.e. to prevent schema corruption) you may want to enable a lock mechanism for a Management Service schema. This lock mechanism prevents concurrent access to a Management Service schema - i.e. only **one single user** can work on the target Management Service schema (with **what ever tool is accessing the schema**) at any one time.

To enable the Management Service schema locking mechanism, run the following SQL script against the Management Service schema, changing <MNGT> to the name of the Management Service schema you want to lock:

```
set search_path=<MNGT>;
select <MNGT>.sys_set_option('Enable CMS Lock Management', 'yes')
```
