

CMS - Delete source code from a Version/Delete a Version

Delete source code from a Version/Delete a Version

In the CAST Management Studio, it is possible to **delete source code from a Version** and **delete a Version**:

- [Delete source code from a Version](#)
- [Delete a version](#)

Delete source code from a version

When you use this option:

- only the extracted source code in the **Delivery folder** is deleted. This frees up disk space - the primary goal of the option.
- the Version will be moved to the **Delivery without source code** section and will be made read only
- log and configuration files will remain in the **Delivery folder**
- you can open the Version in the CAST Delivery Manager Tool, but you cannot edit it or re-package source code.

Note if you action this option, you can immediately reverse the decision using the **Undo** option available on the toolbar. In this situation, the extracted source code will no longer exist in the **Delivery** folder (see [Preferences - Platform Settings](#)) so you will need to package it again - if the source code has subsequently changed, CAST recommends creating a new Version instead.

To action the option:

- Open the [Application editor](#) in which the Version you want to delete is configured.
- Open the [Delivery tab](#) and move down to the **Delivery Accepted** section - the option can only be actioned when the Version is located in this section (i.e. it has been Accepted but is not the Current Version, or it has been Accepted and is the Current Version):

Delivery

Lists source code Deliveries and their current status.

Refresh... Add Version...

▼ Versions in the Delivery folder

Not delivered

Version Name	Version Date	Previous Version

Delivery done

Version Name	Version Date	Previous Version

Delivery accepted

Version Name	Is Current Version	Version Date	Previous Version
V2	<input checked="" type="checkbox"/> true	05/02/14 01:00	V1

Delivery without source code

Version Name	Is Current Version	Version Date	Previous Version
V1	<input type="checkbox"/> false	05/02/14	

- Select the **Version** and click the button (or right click the Version and select **Delete source code from Delivery**)
- The Version's source code will then be deleted and the Version will be moved to to the **Delivery without source code** section and will become read-only. Delivery Managers will no longer be able to work with the Version:

Delivery without source code

Version Name	Is Current Version	Version Date	Previous Version
V1	<input type="checkbox"/> false	05/02/14	

Delete a version

When a version is **deleted**:

- All references to the Version are **permanently** deleted - this includes extracted source code, logs and configuration files in the **Delivery folder**
- This option cannot be reversed.

To delete a Version:

- Open the [Application editor](#) in which the Version you want to delete is configured.

- Open the [Delivery tab](#) and find the Version you want to Delete. You can Delete it from any of the four sections.
- Select the **Version** and click the  button (or right click the Version and select **Delete**).
- The Version will then be permanently deleted and all trace will be removed from the Delivery folder and the CAST Management Studio.
- Deployed source code (i.e. stored in the **Deployment folder**) will NOT be removed.
