

Advanced rescan for CAST Imaging

Target audience - AIP Super Operator

An **advanced rescan** is generally used in situations where you want to work through the steps in the source code delivery, analysis and publish to CAST Imaging process one-by-one. This may be because you want to change certain settings that have been used previously or you want to check results and status at the end of each step in the process. To access AIP Console, use the following URL (ensure you specify the correct **server** and **port number**): `http://<server>:8081/ui/index.html`. The steps required are very similar to those described in [Advanced onboarding for CAST Imaging](#):

Step 1	Ensure prerequisites are complete
Step 2	Advanced rescan for CAST Imaging - add a new version and deliver source code
Step 3	Advanced rescan for CAST Imaging - validate and accept the version
Step 4	Advanced rescan for CAST Imaging - review analysis configuration and execution
Step 5	Advanced rescan for CAST Imaging - analysis and publish to CAST Imaging
