CMS - Add database server
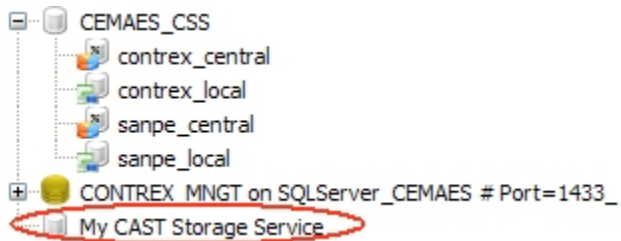

Add database server

By default the Services view will display database servers and associated services automatically using the information defined during the installation process using **CAST Server Manager** - see the **CAST Installation Guide** for more information.

However, you can add further database servers for **accessing additional Analysis/Dashboard/Messurement services installed on them** as described below.

To add a new database server:

- You can either:
    - Click one of the **Add icons** ( ) located on the menu bar of the Services view (click the button that corresponds to the type of Database Server that you would like to add)
    - Right click whitespace in the Services view and select the appropriate **Add new <database_server_type>**

    - Use the dropdown menu icon ( ) located on the menu bar of the Services view
- A component called **My <server_type>** will then be displayed in the view:

- The Database server editor will then be automatically displayed - use this to make all required configuration changes.
- If there are **Analysis/Dashboard/Measurement Services** installed on the newly added Database Server, use the Discover option to automatically define them.
