

CMS - Editors

Editors

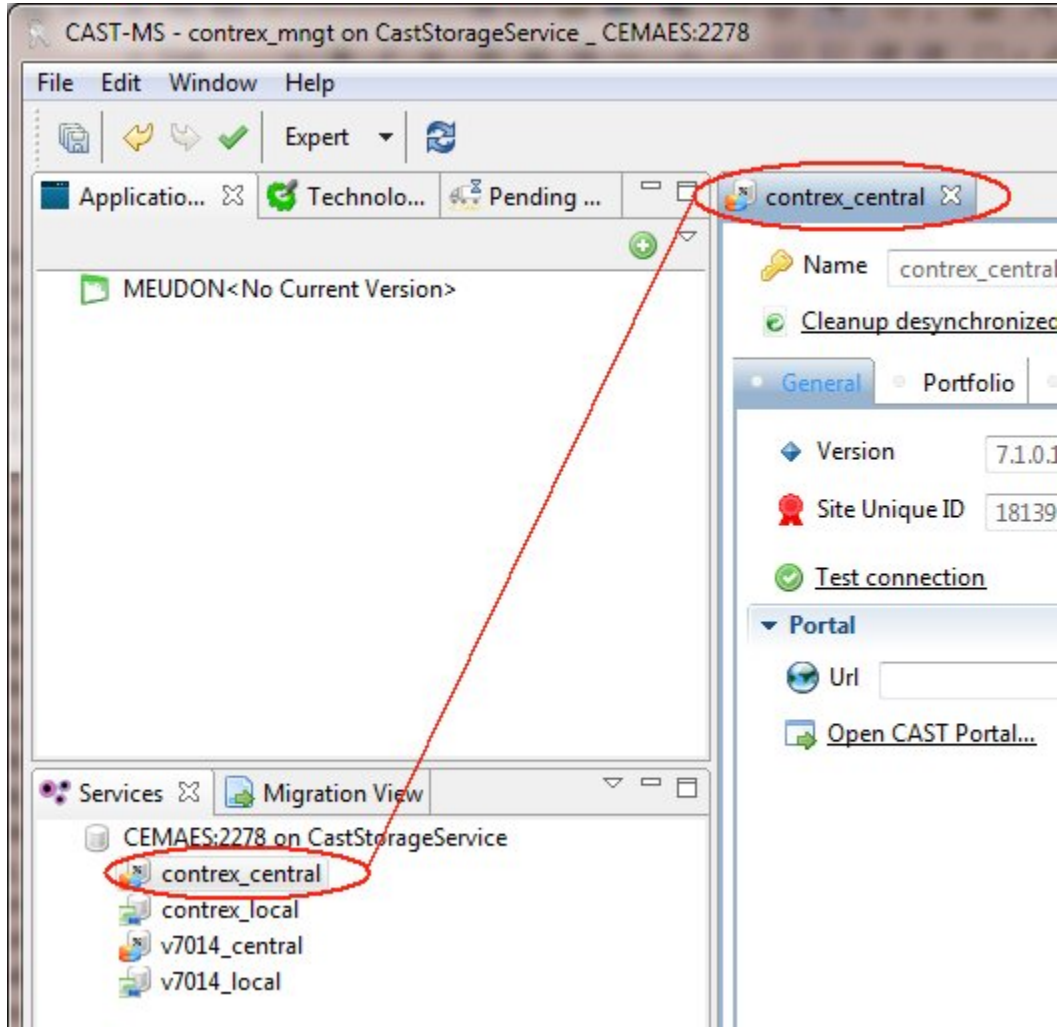

The primary use of Editors is to provide editing capabilities for an element selected in a [View](#). For example:

- The [Database server editor](#) provides a means to modify your various database servers
- The [Dashboard Service editor](#) provides a means to configure the dashboard services associated with the database server

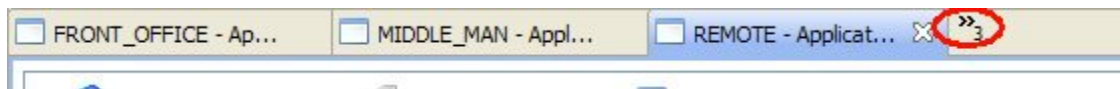

You can find out more detailed information about the CAST Management Studio Editors in [CAST Management Studio - Editors](#).

Display

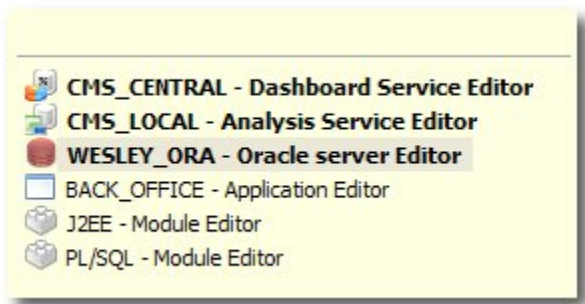

Editors are displayed by double clicking an element in a view. In the example below, a dashboard service element in the [Services view](#) has been double clicked:

Editors can be stacked in the editing area as shown below:

The item circled in red indicates that there are three further tabs open. Clicking the item will display a "sub-dialog box" in which you can select the relevant editor:

Those in bold font are the editors that are already visible.

Scrolling through available editors

You can use the CTRL+F6 shortcut to scroll through all available editors. Hold down the CTRL key and tap F6 - a dialog box will be displayed showing all available editors. Keep holding the CTRL down and tap F6 to cycle through the editors - release F6 when the required view is highlighted to display the editor.

Closing an editor

To close a view, click the X on the editor's tab:

Saving modifications

Unlike other Windows applications, when a change is made in an editor, no * symbol is displayed in the editor's tab to indicate that a modification requires saving. This is because it is not possible to save individual editors, instead the save process is global. See [Save All](#) for more information.
