

DMT - Local DMT workspace

Local DMT workspace

When working with an Application in the CAST Delivery Manager Tool in [CAST AIC Portal mode](#), the Application's configuration files are stored in the **local workspace** used by the CAST Delivery Manager Tool.

This workspace stores all configuration files, logs and extracted source code (following the use of the [Package](#) action). Until you use the [Deliver](#) action, the changes (i.e. the [addition of a new version](#) or the [addition of a new source code package](#)) remain local to the CAST Delivery Tool Manager workspace and will be lost unless you use the [Save](#) action.
