

Install additional tools and patches - optional - v. 1.x

- [Introduction](#)
- [Install default discoverers](#)
- [Patch the AIP Core installation on each Node with CAST-SourceCodeZipScanner.exe](#)
- [Ensure correct release of CAST Support Tool \(CST\) is installed](#)

Summary: this page describes how to perform various actions that may be necessary and not automatically managed by the GUI/CLI installation process.

Introduction

Due to some constraints with regard to the GUI/CLI installation process for the Console/Node packages, it may be necessary to perform some additional manual actions depending on the Console / AIP Core releases you are using. Each is described below.

Install default discoverers

Note that the patching of **the default discoverers is not required** if you are using **Console 1.8.x**.

Download this ZIP file: [DMT_Plugins.zip](#) (~2.5MB) and unpack the ZIP, which should give you a folder called **DMT_Plugins** containing various files and folders:

Copy the **index.xml** file and **all folders** to the "**plugins**" folder located in **ALL Delivery folders that have been configured**. The Delivery folder is configured during the **Node** installation and there will be **one Delivery folder for each Node**, therefore you may need to copy the files/folder multiple times. If prompted, ensure you **overwrite** all files.

Patch the AIP Core installation on each Node with CAST-SourceCodeZipScanner.exe

 Note that the patching of **CAST-SourceCodeZipScanner.exe** is **not required** (regardless of the release of AIP Core that you are using on your Nodes) if you are using **Console 1.8.x**.

The **CAST-SourceCodeZipScanner.exe** tool is required by Console in **each Node** (i.e. each installation of AIP Core), however, it is only delivered with **AIP Core 8.3.9**. Therefore if you are using an older release of AIP Core (**8.3.8**) on your Nodes, you will need to copy this file to ALL your Nodes.

- Download the [CAST-SourceCodeZipScanner.exe](#)
- Copy the file to the **tools** folder located in the root of each AIP Core installation, typically this is located here:

```
%PROGRAMFILES%\CAST\8.3\tools
```

Ensure correct release of CAST Support Tool (CST) is installed

 Note that this step is **not required** if you are using the following releases of AIP Core with Console:

- **AIP Core 8.3.8 - 8.3.12**
- **AIP Core 8.3.16**

The **CAST Support Tool (CST)** is used by Console for [backing up data and configuration options for CAST Support](#). The tool is delivered with AIP Core and is therefore pre-installed on each Node, however, if you are using **AIP Core 8.3.0 - 8.3.7** or **AIP Core 8.3.13 - 8.3.15**, please patch the tool:

Download the latest available ZIP from <https://help.castsoftware.com/hc/en-us/articles/203751708-CAST-Support-Tool-CST-alias-Sherlock>. Unpack the ZIP, which should give you a folder containing various files:

Copy **all files** in this folder to the following location. If you have **multiple Nodes**, you will need to repeat this action for each Node. If prompted, ensure you **overwrite** all files.

```
<AIP_Core_installation>\bin\CastSupportTool
```
