

TCC - Where should sets be created?

Where should sets be created?

If you are creating new sets to detect objects that you want to calibrate (see [Set creation](#)), the following page describes where you should create these sets.

There are two places in which you can create sets, and the location you choose depends entirely on your environment and how you want to configure the CAST Transaction Configuration Center:

Templates node	You should only create sets here if you want to export them to file (.TCCSetup) for distribution and then re-used and applied to live Systems/Applications via an import . Note that sets you create in the Templates node will NOT be applied automatically to any existing Systems/Applications that are already displayed in the CAST Transaction Configuration Center. Instead, please cut/and paste the set/sets from the Templates node to the System node.
System node	You should create sets in this node that are only applicable to the System/Application in question.
