- [Violations reported on Vanilla analysis](#)

Error when displaying source code in CAST dashboards

Most PeopleSoft objects don't have associated source code as they correspond to a configuration. In the CAST Engineering Dashboard/CAST Application Engineering Dashboard an error will therefore be displayed when trying to display the object source code (example error message from the CAST Engineering Dashboard):

ERROR

The source file associated with the object you are requesting source code for is absent from the Local Site. Page cannot be displayed. Contact portal administrator.

No bookmarks are displayed for violations in source code in CAST dashboards

When using the CAST Engineering Dashboard or the CAST Application Engineering Dashboard, no "bookmarks" will be displayed to indicate where violations occur in source code. This is a limitation of the extension.

Violations reported on Vanilla analysis

Violations are incorrectly reported for standard PeopleSoft objects originating in the Vanilla analysis. This bug will be fixed in a future release.
