

TCC - Modify existing sets

Modify existing sets

It is possible to modify existing sets in both the [System node](#) and [Templates node](#) (except for sets in the [Built-in parameters node](#)).

System node

When modifying existing sets in the System node, there is no impact on any other node. You will, however, need to [generate the set](#) to ensure that it is correctly working and then use the [Compute](#) option to display the new results.

Template node

If you modify an existing set in the Template node, please bear the following points in mind:

- Modifications (including set deletion) will not be passed to the equivalent set in any Systems/Applications displayed in the CAST Transaction Configuration Center
- If you delete ALL sets in the **By Type** node when working in the [Templates node](#), and then close and re-launch the CAST Transaction Configuration Center, all deleted sets will be re-displayed in the Templates node. Deleting only some of the sets, and then closing and re-launching the CAST Transaction Configuration Center will NOT cause all sets to be re-displayed.
